

## Metal Machining Facility

This is the result of our Floccin 1105 product treating a sample from a Metal machining facility. The sample was at a pH of 9 and CO<sub>2</sub> was added to bring the pH down to neutral (pH at 7). The Floccin 1105 was very effective at clarifying the waste, breaking the strong oil emulsion and capturing the oil. The dosage was minimal with the Floccin addition (~ 1g/1000ml).
